

IR DigiDom Wireless Transmission 433MHz

Remote control infrared (IR) signal extender system that allows to remotely control devices in rooms other than the user's; for example: a satellite receiver, a video player, a stereo, etc.

The transmission band can be configured in eight switch-selectable channels.

It consists of a transmitter and a receiver: the commands sent by the remote control travel via radio (air) to the controlled element, allowing to switch channels on the satellite receiver from another TV set, for example.
